Revised Birth and Fertility Rates for the 1990s and New Rates for Hispanic Populations, 2000 and 2001: United States

by Brady E. Hamilton, Ph.D.; Paul D. Sutton, Ph.D.; and Stephanie J. Ventura, M.A., Division of Vital Statistics

Abstract

Objectives—This report presents revised birth and fertility rates for 1991–99, as well as previously published revised rates for 2000–2001, based on populations consistent with the April 1, 2000, census. Revised rates for Hispanic subgroups (Mexican, Cuban, Puerto Rican, and other Hispanic) are also included in this report. Rates are presented by age, race, and Hispanic origin of mother; by age, race, Hispanic origin, and marital status of mother; by age and race of father; and by age of mother and by State. This report also presents new rates by age and Hispanic origin (subgroups) of mother for 2000 and 2001. The revised rates are compared with previously published rates that used July 1 population estimates based on the 1990 census.

Methods—Populations for most rates were produced for the Centers for Disease Control and Prevention's National Center for Health Statistics (NCHS) under a collaborative arrangement with the U.S. Census Bureau. Populations for teenage subgroups 15–17 and 18–19 years by race and Hispanic subgroups were produced by NCHS. The populations reflect the results of the 2000 census. This census allowed people to report more than one race for themselves and their household members, and also separated the category for Asian or Pacific Islander persons into two groups (Asian and Native Hawaiian or Other Pacific Islander). These changes reflected the Office of Management and Budget's (OMB) 1997 revisions to the standards for the classification of Federal data on race and ethnicity. Because only one race is currently reported in birth certificate data, the 2000 census populations were “bridged” to the single race categories specified in OMB's 1977 guidelines for race and ethnic statistics in Federal reporting, which are still in use in the collection of vital statistics data.

Results—Revised population-based birth and fertility rates from 1991 to 1999, based on the 2000 census, are with few exceptions lower than the rates previously published based on populations projected from the 1990 census. As expected, the differences in rates for American Indians, Hispanics, and Asian or Pacific Islanders were considerable.

However, revised rates for most other population subgroups (i.e., non-Hispanic whites and blacks) differed little from those previously published. Regardless of the magnitude, the differences between the 2000-based and 1990-based rates progressively diverged through time so that previously published trends were generally retained but lower. Because of this shift, especially for Hispanic women, the differentials in fertility among population subgroups remain, but were somewhat reduced.

Keywords: revised birth and fertility rates

Highlights

Revised birth rates for **teenagers** confirm the previously reported steady declines over the decade of the 1990s. Rates fell to historic low levels, with sizable declines recorded for teenagers in all age groups and for population subgroups by race and Hispanic origin. The overall rate for teenagers 15–19 years fell 27 percent between 1991 and 2001. The rate for black teenagers plummeted 37 percent. The downward trends for American Indian and Hispanic teenagers are much larger on the basis of the revised rates compared with the

Acknowledgments

This report was prepared under the general direction of James A. Weed, Acting Director of the Division of Vital Statistics (DVS) and Stephanie J. Ventura, Chief of the Reproductive Statistics Branch (RSB). T. J. Mathews, Melissa M. Park, Martha Little Munson, and Yashodhara Patel of RSB provided content review. Staff of the Data Acquisition and Evaluation Branch carried out quality evaluation and acceptance procedures for the State data files on which this report is based and were responsible for receipt and processing of the basic data file. The Registration Methods staff of DVS consulted with State vital statistics offices regarding the collection of birth certificate data. This report was edited by Demarius V. Miller, typeset by Jacqueline M. Davis, and graphics were produced by Jarmila G. Ogburn of the Publications Branch, Division of Data Services.

previously published rates. The birth rate for American Indian teenagers fell 33 percent and the rate for Hispanic teenagers dropped 17 percent, according to the revised rates compared with decreases of 22 percent and 13 percent, respectively, according to the rates based on postcensal population estimates derived from the 1990 census. The revised birth rates using 2000 census-based population estimates indicate a narrower range in rates among population subgroups than was suggested by the previously published rates. This mainly reflects the lower rates for Hispanic women, who account for about 3 in 10 teenage births.

The trends portrayed by the revised rates for married and unmarried women are essentially the same as those suggested by the previously published rates based on 1990 census-derived populations. The overall effect of the revised rates was to narrow the disparity among population groups, as the revised rates for Hispanic women in particular were considerably lower than the originally published rates.

The birth rate for men aged 15–54 years fell between 1990 and 2001 with most of the decline occurring by 1997. The revised rates in 2001 by age and race for men under age 55 years were lower than the previously published rates for all but white men aged 40–44 years. Despite the anomaly, the revised rates for white men in general and white men aged 25–29 and 30–34 years in particular were reduced more as a result of the revised population than rates for black men. This primarily reflects the more dramatic reductions observed for Hispanic men.

Birth and fertility rates for most States paralleled those observed at the national level. State birth rates generally declined through 1997 but from 1997 through 2001 tended to show considerable annual fluctuation. In 2001 the revised birth rates were lower than the previously published rates for every State. The revised rates for 2001 ranged from 1 to 10 percent lower than the previously published rates. As expected those States with relatively larger Hispanic populations tended to also be among those with the greatest differences between the revised and previously published rates.

Introduction

This report presents revised birth and fertility rates for the United States for the intercensal years, 1991–99, along with the previously published revised rates for 2000 and 2001, and revised rates for Hispanic subgroups (Mexican, Cuban, Puerto Rican, and other Hispanic) for 1991–2001, as well as revised rates for States. The population estimates on which most of the revised rates are based were produced for the Centers for Disease Control and Prevention's National Center for Health Statistics under a collaborative arrangement with the U.S. Census Bureau (1–13).

The focus of the current report is to provide more accurate levels of birth and fertility rates for the intercensal years, 1991–99. To place the revised rates in context and to provide an overall indication of the trends over the last decade, rates for the same population groups based on the 1990 census are also shown. This report, which also includes revised birth and fertility rates for 2000 and 2001, will review the impact of the revised populations on variations in trends and differentials for population subgroups. Revised rates for 2000 and 2001 were recently published (14). Previously published birth and fertility rates for 1991 to 2001 were based on postcensal population estimates derived from the 1990 census (15–27).

When the earlier reports were published, it was noted that the rates in those reports were generally larger than would be the case if 2000 census-based estimates were used (14–16). The magnitude of the overestimates varies by population subgroup, but the overestimates are particularly large for American Indian, Hispanic, and Asian or Pacific Islander (API) population groups. For example, the general fertility rate for 2001 for American Indian women in the current report (estimated from the 2000 census) is 18 percent lower than the rate originally published (based on the 1990 census). For Hispanic women, the rate is 11 percent lower and for Asian or Pacific Islander women 7 percent lower. In contrast, the difference between the 1990-based and 2000-based fertility rates is negligible for non-Hispanic white women (less than 1 percent), and only slightly more sizable for black women (3 percent in 2001).

The overall effect of the revised rates is that the range in rates among population subgroups is somewhat smaller than indicated by the previously published rates, mainly reflecting the lower revised rates for Hispanic women. In addition to these differences by population subgroup, the revised rates by age differ from the originally published rates.

Methods

Birth and fertility rates shown in this report are based on 100 percent of the birth certificates registered in all States and the District of Columbia. More than 99 percent of births occurring in this country are registered (28). The data are provided to the National Center for Health Statistics (NCHS) through the Vital Statistics Cooperative Program (VSCP). The VSCP includes all States, the District of Columbia, and the territories. Data for the territories are not shown in this report because revised populations are not yet available for these areas.

Race and Hispanic origin are reported independently on the birth certificate. In tabulations of birth data by race and Hispanic origin, data for Hispanic persons are not further classified by race because the majority of women of Hispanic origin report themselves as white. Most tables in this report show rates for these categories: white total, non-Hispanic white, black total, non-Hispanic black, American Indian total, Asian or Pacific Islander (API) total, and Hispanic. Rates for American Indian and API populations are not shown separately by Hispanic origin.

The populations used in this report were produced under a collaborative arrangement with the U.S. Census Bureau and are based on the 2000 census counts. Reflecting the new guidelines issued in 1997 by the Office of Management and Budget (OMB), the 2000 census included an option for individuals to report more than one race as appropriate for themselves and household members (29). In addition, the 1997 OMB guidelines called for reporting of Asian persons separately from Native Hawaiians or other Pacific Islanders. In the 1977 OMB guidelines, data for Asian or Pacific Islander persons were collected as a single group (30). Birth certificates currently collect only one race for each parent in the same categories as specified in the 1977 OMB guidelines. In addition, birth certificate data do not report Asians separately from Native Hawaiians or other Pacific Islanders. The birth certificate data by race (the numerators for birth and fertility rates) are thus currently incompatible with the population data collected in the 2000 census (the denominators for the rates).

In order to produce revised birth and fertility rates for 1991 through 2001, it was necessary to "bridge" the reported population data for

multiple race persons back to single race categories. In addition, the 2000 census counts were modified to be consistent with the 1977 OMB racial categories, that is, to report the data for Asian persons and Native Hawaiians or other Pacific Islanders as a combined category, Asian or Pacific Islanders (31,32). The procedures used to produce the "bridged" populations are described in separate publications (33,34). It is anticipated that "bridged" population data will be used over the next few years for computing population-based rates. Beginning with births occurring in 2003, some States will be collecting information on multiple race reporting. As States gradually begin to collect data on race according to the 1997 OMB guidelines, it is expected that use of the "bridged" populations can be discontinued.

The 1991–99 populations estimates by race for women aged 15–17 and 18–19 years and for the Hispanic subgroups were prepared by NCHS (see "Technical Notes") because revised population estimates for these groups based on the 2000 census were not available from the U.S. Census Bureau when this report was prepared. Rates for teenagers based on these population estimates are intended as interim measures and caution should be used in interpreting the rates and trends. When the necessary population estimates based on the 2000 census become available from the U.S. Census Bureau, the rates for women aged 15–17 and 18–19 years will be recalculated and presented. Revised population estimates for the Hispanic subgroups are not expected.

Readers should keep in mind that the population data used to compile the birth and fertility rates by race and ethnicity shown in this report are based on special estimation procedures. They are not true counts. This is the case even for the 2000 populations that are based on the 2000 census. The estimation procedures used to develop these populations may contain some errors. Smaller populations, for example, American Indians, are likely to be affected much more than larger populations by this measurement error (33). While the nature and magnitude of these errors is unknown, the potential for error should be kept in mind when evaluating trends and differentials. Over the next several years, additional information will be incorporated in the estimation procedures, possibly resulting in further revisions of the population estimates.

Results

Crude birth rate and general fertility rate

The **crude birth rate** fell 16 percent from 16.7 births per 1,000 persons in 1990 to 14.1 in 2001 ([tables 1](#) and [2](#)). During this time, the rate declined in all but 2 years (1998 and 2000) ([figure 1](#)). Between 1990 and 1997, the rate fell 15 percent, accounting for most of the total decline. Since 2000, the rate has fallen 2 percent.

The basic trend observed for the revised rates is consistent with that observed for the previously published rates using the 1990-based population estimates ([tables 3](#) and [4](#)). For nearly all data years and race and Hispanic origin groups, the 2000-based rates were lower than the 1990-based rates. As expected, the difference between the rates progressively diverged through time. Consequently, the trends seen in the 1990-based rates generally were confirmed, although the revised rates were at a lower level. However, the trends and differentials of the rates varied substantially by race and Hispanic origin population group. Overall rates for non-Hispanic whites were least affected, while rates

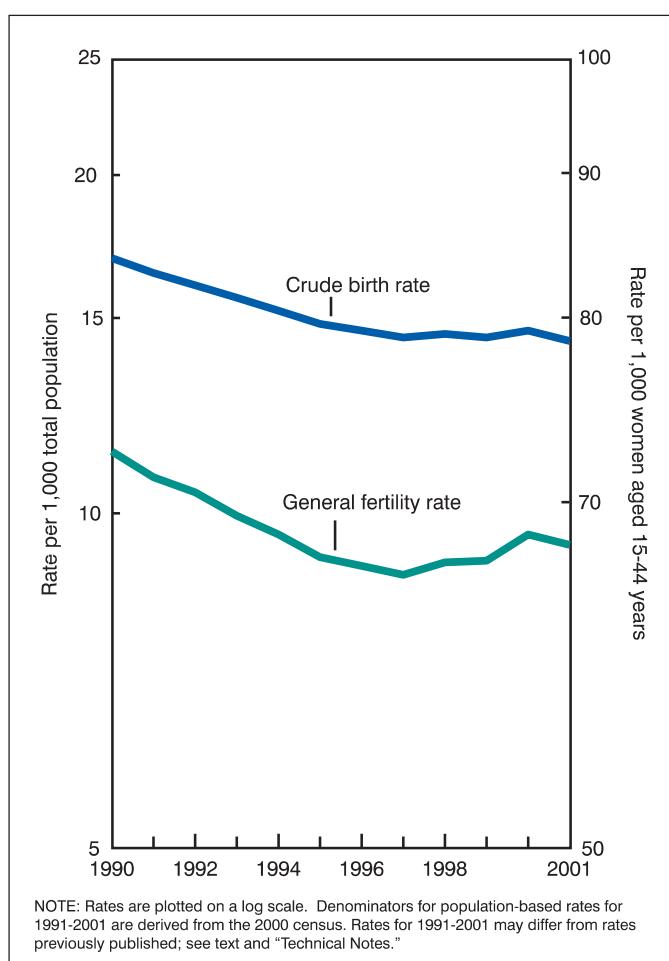

Figure 1. Revised crude birth rates and general fertility rates: United States, 1990–2001

for Hispanics and American Indians were substantially affected. The effects for non-Hispanic blacks and Asian or Pacific Islanders were intermediate. The trend in the revised rates from 1990 to 2001 ranged from a 13 percent decline for white persons to a 28-percent decline for American Indian and non-Hispanic black persons ([tables 1](#) and [2](#)). While the 2000-based rates were generally lower than 1990-based rates, the largest differences were measured for the American Indian and Hispanic populations, as expected (14–16). The smallest difference was measured for the non-Hispanic white population.

The **general fertility rate**, which relates births to the number of women in the childbearing ages, fell 8 percent from 1990 (70.9) to 65.3 per 1,000 women aged 15–44 years in 2001 ([tables 1](#) and [2](#)) ([figure 1](#)). From 1990 to 1997, the rate dropped every year to 63.6, a decline of 10 percent. Between 1997 and 2000, the rate increased 4 percent from 63.6 per 1,000 women aged 15–44 years to 65.9, but fell 1 percent in 2001 to 65.3.

Fertility rates also varied considerably by race and Hispanic origin, but in all instances (except for Cubans) declined. Between 1990 and 2001, the rates dropped as little as 5 percent for white women to as much as 24 percent for American Indian women. Between these extremes, the rate for Asian or Pacific Islanders (API) declined 8 percent, as did the rates for non-Hispanic white women, whereas the rate for Hispanic women dropped 11 percent. The decline for black women was 22 percent.

With few exceptions (the 2000-based rates were higher than the 1990-based rates for Puerto Rican and Other Hispanic women in 1991), the revised general fertility rates were lower than the 1990-based rates. As with the crude birth rate, the difference between the 2000-based and 1990-based rates increasingly diverged through time with the trends seen in the 1990-based rates being generally substantiated although the revised rates shifted to a lower level ([tables 3 and 4](#)) ([figure 2](#)). However, the differences or degree of shift again varied by race and Hispanic origin ([tables 3 and 4](#)). The smallest difference was measured for the non-Hispanic white population, whereas the largest difference was measured for Hispanic and American Indian women, as expected ([14–16](#)).

Age of mother

Birth rates for teenagers were at historic low levels in 2001. Rates have declined steadily since reaching a peak in 1991. During the decade 1991–2001, the overall rate for teenagers fell 27 percent, or about 3 percent annually, from 61.8 per 1,000 teenagers 15–19 years in 1991 to 45.3 in 2001 ([table A](#) and [figure 3](#)). The effect of the revised intercensal population estimates on the rates was relatively small overall. Annual rates for teenagers during 1991–99 based on the revised intercensal populations using the 2000 census differ little from the rates previously published that were based on population estimates derived from the 1990 census ([tables 3, 4, and A](#)).

Rates declined for teenagers in all age groups. The birth rate for the **youngest teenagers 10–14 years** fell from 1.4 per 1,000 in 1991 to 0.8 per 1,000 in 2001. The 2001 rate is the lowest recorded in 35 years (0.8 in 1966) ([27](#)).

The **rate for teenagers 15–17 years** declined steeply during the 1990s. The rate fell 36 percent, from 38.6 in 1991 to 24.7 in 2001. The rate in 2001 was a record low for the Nation ([14,27](#)). The pace of decline in the rate for 15- to 17-year-olds accelerated during recent years, from 4 percent per year during 1991–99 to more than 6 percent annually during 1999–2001.

The **birth rate for older teenagers 18–19 years** also fell during the 1990s, but the decline was more moderate. The overall reduction was 19 percent, from 94.0 per 1,000 in 1991 to 76.1 in 2001, reaching an historic low. The decrease was fairly steady throughout the decade.

Birth rates for teenagers by race and Hispanic origin all declined markedly from 1991 to 2001 ([tables 1, 2, and A](#)). Trends in rates for non-Hispanic white and black and Asian or Pacific Islander teenagers were affected little by the transition to 2000 census-based intercensal populations, whereas the trends for American Indian and Hispanic teenagers were affected substantially (see [tables 3, 4, A, and figure 4 for 2001 data](#)).

The birth rate for non-Hispanic white teenagers fell from 43.4 per 1,000 aged 15–19 years in 1991 to 30.3 in 2001, a 30-percent decrease. The rate for non-Hispanic black teenagers plunged 38 percent, from 118.2 per 1,000 in 1991 to 73.5. Both groups recorded record lows. These trends on the basis of the revised rates are similar to those measured from 1990 census-based populations (reductions of 31 and 36 percent, respectively) ([15](#)).

The downward trends in teenage childbearing for American Indian and Hispanic teenagers are much more striking when the rates computed from the revised 2000 census-based populations are examined. Based on the revised populations, the birth rate for American Indian

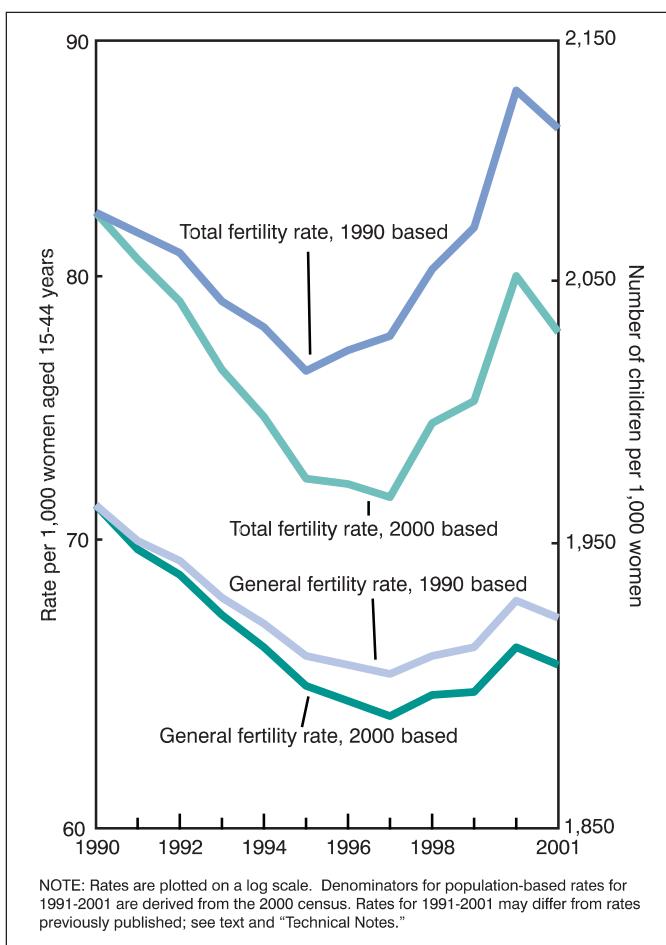

Figure 2. General fertility rates and total fertility rates based on 1990 and 2000 census: United States, 1990–2001

teenagers fell 33 percent from 1991 (84.1 per 1,000) to 2001 (56.3). Previously published rates suggested a decline of 22 percent ([15](#)). It is apparent from [tables 3 and 4](#) that the onset of the disparity in the old and revised rates was early in the 1990s and the gap widened steadily over the decade. The actual decline in birth rates for American Indian teenagers was understated for most of the decade, yet the year-to-year trends between the two series are fairly similar ([figure 5](#)).

Among Hispanic teenagers, the birth rate fell from 104.6 per 1,000 in 1991 to 86.4 in 2001, a decline of 17 percent. Previously published rates suggested a smaller decline of 13 percent ([15](#)). As was the case for the birth rate for American Indian teenagers, the disparity between the old and revised rates for Hispanics grew steadily through the decade, although the year-to-year changes differed little between the two series ([figure 6](#)).

Revised birth rates are also available for teenagers in Hispanic subgroups. The previously published rates for these groups were also overstated, but the variation among subgroups remains. Birth rates continue to be highest among Mexican teenagers (95.4 per 1,000 aged 15–19 years in 2001), followed by Puerto Rican teenagers (82.2 per 1,000) and "other" Hispanic teenagers (65.3 per 1,000). Population estimates for Cuban teenagers are not adequate for computing statistically reliable birth rates, except for census years (see "Technical Notes"). However, Cuban teenagers are believed to have the lowest

¹Includes origin not stated.²Includes persons of Hispanic and non-Hispanic origin.³Persons of Hispanic origin may be of any race.⁴See "Technical Notes" for information on reporting areas in 1991.

birth rates among Hispanic subgroups (26,36). The overall and year-to-year trends in the rates for Hispanic subgroups computed on the basis of the 2000 census estimates differ somewhat from the trends derived from the 1990 census-based populations, yet the overall levels of the rates for the subgroups are consistent.

Women in their twenties—Women in their twenties historically account for the largest share of all births although the share has declined in recent years, from 57 percent in 1990 to 52 percent in 2001. The **birth rate for women aged 20–24 years** declined 9 percent to 106.2 per 1,000 in 2001 from 116.5 in 1990. From 1990 to 1995, the rate dropped each year to 107.5, or 8 percent. Between 1995 and 2001, the birth rate fluctuated annually. The **birth rate for women aged 25–29 years** was 113.4 per 1,000 in 2001, 6 percent lower than in 1990 (120.2). The rate declined for most of the 1990s, except for a modest increase between 1997 and 2000, from 110.2 to 113.5. The revised birth rates for women aged 20–24 and 25–29 years were lower than the 1990-based rates. As with the other measures of fertility, the difference between the 2000-based and 1990-based rates increasingly diverged through time with the trends seen in the 1990-based rates being generally retained but lowered.

Women in their thirties—The **birth rate for women aged 30–34 years** in 2001 (91.9 births per 1,000 women) was 14 percent above that in 1990 (80.8). While the pace of increase in this rate has slowed in the past decade, it is noteworthy that the rate increased each year between 1990 and 2001. The **birth rate for women aged 35–39 years** also increased each year between 1990 and 2001, up 28 percent to 40.6 per 1,000 in 2001 from 31.7 in 1990. Like the rate for women aged 30–34 years, the pace of increase in the rate for women aged 35–39 years has slowed since 1990. As before, the revised birth rates for women aged 30–34 and 35–39 years were lower than the 1990-based rates. The difference between the 2000-based and 1990-based rates increasingly diverged again through time with the trends lowered.

Women in their forties—The **birth rate for women aged 40–44 years** was 8.1 per 1,000 in 2001, 47 percent higher than in 1990, which

**Figure 3. Birth rates by age of mother: United States, 1990–2001**

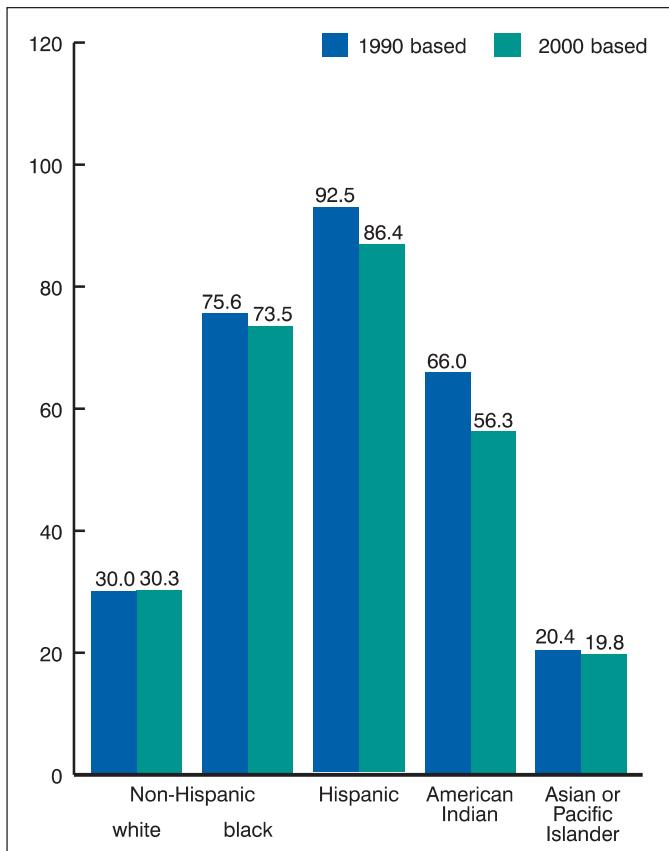

Figure 4. Birth rates for teenagers by race and Hispanic origin for 2001, 1990 census and 2000 census based

was 5.5 per 1,000. During this time, the rate increased nearly every year. The **birth rate for women aged 45–49 years** has more than doubled between 1990 and 2001, increasing from 0.2 in 1990 to 0.5 in 2001. Comparing the 2000-based rates with the 1990-based rates, the overall difference for women aged 40–44 years is negligible. There is no difference for women aged 45–49 years.

Live-birth order

Revised birth rates from 1990 to 2001 by age of mother and live-birth order, by race and Hispanic origin are shown in **tables 5 and 6**. The **first birth rate** was 29.0 first births per 1,000 women aged 15–44 years in 1990, and declined to 25.9 in 1997, a drop of 8 percent. Since 1997, the first birth rate differed little from its level in 2001 (26.0).

Declines in first birth rates from 1990–2001 were particularly large for teenagers aged 15–19 years (21 percent). Rates for women in their twenties declined between 1990 and 2001, by 11 percent for ages 20–24 years, and 8 percent for ages 25–29 years. In contrast first birth rates have risen substantially for women in their thirties and forties, increasing 25 percent for women aged 30–34 years, 36 percent for women aged 35–39 years, and 70 percent for women aged 40–44 years.

Changes for second and higher order birth rates from 1990 to 2001 were generally more modest. Second order birth rates declined 7 percent between 1990 (22.8 per 1,000) and 2001 (21.3). Rates for third through fifth birth orders were 4 to 6 percent lower in 2001 compared

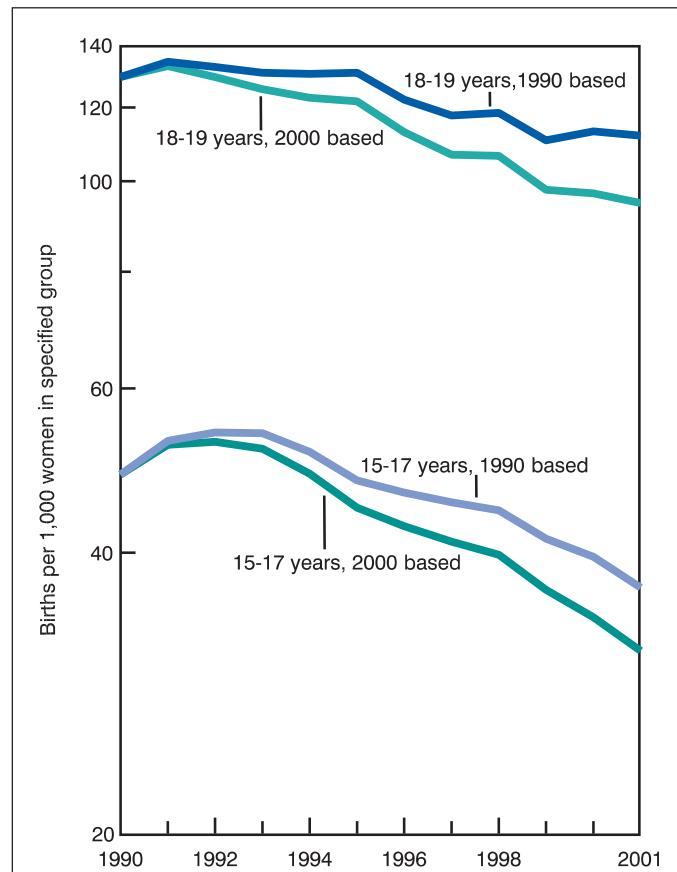

Figure 5. Birth rates for American Indian teenagers 15–17 and 18–19 years, 1990–2001

with 1990, and the rates for sixth and seventh order births declined by 10 percent. There was no change in the rate for eighth and higher order births.

The rates by live-birth order also varied by race and Hispanic origin. Between 1990 and 2001, the revised 2000-based first birth rate declined as little as 1 percent for Asian or Pacific Islander (API) women and as much as 22 percent for black women. The rates for non-Hispanic white women declined by 12 percent whereas the rates for Hispanic and American Indian women declined 13 and 15 percent, respectively. The first birth rate for Cuban women increased 14 percent from 1990 to 2001.

Total fertility rate

The total fertility rate (TFR) shows the potential impact of current fertility patterns on completed family size. The TFR indicates the number of births that a hypothetical group of 1,000 women would have if they experienced throughout their childbearing years the age-specific birth rates observed in a given year. Because it is based on age-specific birth rates, the TFR is age adjusted; it is not affected by changes over time in age composition. The revised **TFR** declined 2 percent from 2,081.0 per 1,000 women in 1990 to 2,034.0 in 2001 (**tables 1 and 2**). From 1990 to 2001, the overall TFR never

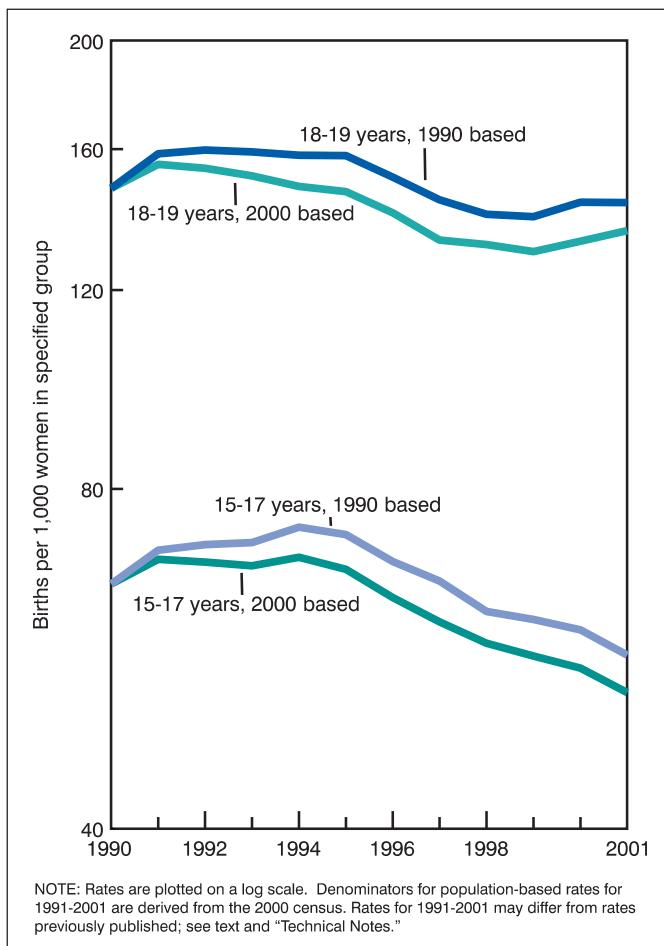

Figure 6. Birth rates for Hispanic teenagers 15–17 and 18–19 years, 1990–2001

exceeded “replacement” (2,100 per 1,000 women). The “replacement” rate is considered the value at which a given generation can exactly replace itself.

As is the case for the other measures of fertility, the TFR differed substantially by race and Hispanic origin. Rates for Hispanic and non-Hispanic black women from 1990 to 2001 exceeded “replacement” every year, whereas the rates for non-Hispanic white and Asian or Pacific Islander (API) women were consistently below “replacement” during that time. For the remaining groups, the TFRs were variable. Nevertheless, while the TFRs of these groups were quite distinct, the TFR declined for all groups between 1990 and 2001. Moreover, with few exceptions (the 2000-based rates were higher than the 1990-based rate for Puerto Rican and Other Hispanic women in 1991), the 2000-based TFRs were lower than the 1990-based rates; and, as before, the shift in the trends due to the revised denominators differs according to race and Hispanic origin (tables 3 and 4) (figure 2). The greatest difference was again seen for American Indian and Hispanic women.

Birth rates for unmarried women

Revised birth rates for unmarried women for the 1990s through 2001 are shown in table 7. The trend portrayed by the revised rates is essentially the same as that suggested by the previously published rates (15). Childbearing by unmarried women peaked in 1994, as previously reported (37), and has changed very little since 1995. The

revised birth rate for unmarried women in 2001 was 43.8 per 1,000 aged 15–44 years, compared with 45.0 as previously published (15). Rates declined for women in age groups under 20 years and have increased somewhat for women aged 20 years and over. Women aged 20–24 years continue to have the highest nonmarital birth rate, 71.2 per 1,000 in 2001.

The nonmarital birth rate for non-Hispanic white women changed little since 1995 (28.4 per 1,000); it was 27.8 in 2001. The rate for unmarried black women declined to 68.2, an historic low level (37). Between 1990 and 2001, this rate fell 25 percent. The birth rate for unmarried Hispanic women fell 8 percent from its 1994 peak, 95.8, to 87.8 in 2001. The previously published rate for Hispanic women for 2001 was 98.0. The birth rate for unmarried Asian or Pacific Islander women was the lowest of all groups, 21.2 per 1,000 in 2001. As was the case for most other rates, the overall effect of the revised rates was that the range in rates among population groups narrowed, mainly reflecting the lower revised rates for unmarried Hispanic women.

Birth rates for married women

Birth rates for married women fell steadily from 1990 (93.2 per 1,000) to 1996 (82.3), a decrease of 12 percent (table 8). Previously published rates suggested a 10-percent decline (93.2 to 83.7). The rate then increased slowly to 87.4 in 2000 and fell slightly in 2001 to 86.7. The 2001 rate, 86.7, was 5 percent higher than the rate for 1996. The trend portrayed by the revised rates for married women, as is the case for unmarried women, is essentially the same as that suggested by the previously published rates (15,37). Married teenagers 18–19 years have the highest birth rates, 306.8 per 1,000 aged 18–19 years in 2001; marital birth rates decline successively with advancing maternal age.

Among population subgroups, married Hispanic women have the highest birth rates, 103.1 per 1,000 aged 15–44 years in 2001, followed by Asian or Pacific Islander women (99.7 per 1,000); non-Hispanic white women (84.2) and black women (66.5). Marital birth rates generally declined between 1990 and the mid-1990s for all groups, followed by small fluctuations or slight increases. The overall effect of the revised rates was to narrow the disparity among population groups, as the revised rates for Hispanic women in particular were considerably lower than the originally published rates.

Birth rates by age of father

The birth rate per 1,000 men aged 15–54 years fell 16 percent between 1990 and 2001 (from 58.4 to 49.0) (table 9). The birth rate fell steadily between 1990 and 1997 to 49.4 (15 percent), accounting for most of the total decline. From 1997 to 2001 the birth rate fluctuated significantly from year to year ranging from 49.0 to 50.0.

The pattern seen in this revised trend closely resembles that of the 1990-based rates with steady declines to 1997 followed by several years of fluctuation. The most obvious difference between the two trends is the overall lowering of the rates. The gap between the 1990 based and the revised rates increases with time, with the revised 2001 birth rate 3 percent lower than the 1990-based rate (50.6). The revised rates are less than the 1990-based rates for every year after 1990.

Age-specific birth rates per 1,000 men fell between 1990 and 2001 for men under age 30 years and for men aged 45 years and over. Birth rates increased for men between ages 30 and 44 years. Birth rates

were up for teenage males between 1990 and 1991, and stayed essentially unchanged through 1994. In 1995, however, birth rates for teenage males began a significant decline, which continued into 2001 (falling from 24.6 in 1994 to 18.5 in 2001). Birth rates for males in their early twenties declined between 1990 and 2001 (from 88.0 to 78.5) with only minor increases in 1998 and 2000. Overall birth rates were down for men aged 25–29 years as well. However, while rates for younger men consistently fell, birth rates for men in their late twenties showed a strong rebound between 1997 and 2000 before once again turning downward. Trends in birth rates for men aged 30–34 and 35–39 years also rebounded after an initial decline between 1990 and 1995. However, in the case of men in their thirties, the increase continued despite slowing between 2000 and 2001; it had surpassed the 1990 rate by the late 1990s. Birth rates for men aged 40–44 years increased 6 percent and those aged 45 years and over were slightly down.

The revised rates differ from the 1990-based rates for some age groups more than others. The impact of the revised rates as measured by the percent difference between the 1990-based rate and the revised rates in 2001 was only one percent or less for teenage males and males over 40 years of age. On the other hand differences between 1990-based and revised rates were larger for men aged 35–39 years, 2 percent, and for men aged 25–29 years, 9 percent. For men aged 25–29 years, this was sufficient to change the trend from a net increase to a net decrease for the entire 11 year period shown.

Birth rates for black men were higher than for white men for virtually every age group during each year between 1990 and 2001. The only exception was for men age 30–34 years. In 1995 birth rates for white men first exceeded those for black men. Birth rates for white men aged 30–34 years continued to be higher than for black men through 2001. With the exception of men aged 30–34 years just mentioned, birth rates were higher for black men than white men, but the difference between the two groups decreased between 1990 and 2001. Overall birth rates for black men fell 25 percent between 1990 and 2001 (from 84.9 to 63.3), while birth rates for white men fell only 14 percent (from 54.6 to 46.9). Birth rates for black men declined for all age groups and, in general, outpaced declines for white men.

As for all races, these revised rates for white and black men generally reflected the 1990 population based trends. Revised rates for black males typically deviated from the 1990-based rates less than rates for white men, with the revised birth rates for black men in 2001 never more than 6 percent less than the 1990-based rates for any age group. At the same time certain revised rates for white men in 2001 were as much as 10 percent less than the 1990-based rate. Birth rates for white men aged 25–29 and 30–34 years were most impacted by the revised rates, falling 10 percent and 7 percent respectively. The revised populations had more impact on rates for white men because these rates also included births for Hispanic men. As noted earlier, the effect of the revised populations was particularly large for Hispanic fertility patterns.

Information on age of father is often missing on birth certificates of children born to unmarried women, especially those under age 25 years (15). In 2001 the father's age was not reported for 13 percent of all births, 38 percent of all nonmarital births, and 24 percent of all births to women under age 25. In order to compute birth rates by age of father, births where age of father is not stated are distributed in the same proportion as births where age of father is reported, within each 5-year age of mother interval. This procedure avoids the distortion in rates that would result if the relationship between age of mother and

age of father were disregarded. The procedure for computing birth rates by age of father are described in more detail in the "Technical Notes" section of "Births: Final Data for 2001" (15).

Birth and fertility rates by State

The **crude birth rate** fell in every State between 1990 and 2001 ([table 10](#)), with statistically significant declines in every State except Utah. Birth rate trends for most States paralleled those seen at the national level, which steadily declined 15 percent between 1990 and 1997. From 1997 to 2001 the national birth rate declined but only by 1 percent with significant annual fluctuation between increasing and decreasing birth rates.

Between 1990 and 1997 birth rates fell annually for most States with rates for every State falling significantly over the entire period. For the period 1990 to 1997, overall birth rate declines ranged from 4 percent for Utah to 25 percent for Alaska and 28 percent for the District of Columbia. Between 1997 and 2001 overall birth rates increased for 18 States (10 States significantly), fell for 31 States and the District of Columbia (significantly for 16 States and the District of Columbia), and the rate was unchanged for 1 State. However, while birth rates declined overall for most States between 1997 and 2001, there was considerable annual variation. Between 1997 and 2001 changes in the birth rate ranged from a decrease of 7 percent for North Dakota to an increase of 7 percent for Colorado. The ratio between States with increasing and those with decreasing birth rates varied widely from year to year. In 1998 birth rates increased for 32 States with the increase statistically significant for 9 States (Colorado, Georgia, Indiana, Kansas, Mississippi, North Carolina, Tennessee, Utah, and Virginia). One year later (1999) birth rates increased in only 11 States, none significantly. In 2000 birth rates were once again up in the majority of States, significantly in 18 States. Finally, in 2001, birth rates flipped again with rates declining significantly in 30 States and essentially unchanged in the other 20 States and the District of Columbia.

While the overall trend in birth rate for most States was similar to the national rate, birth rates for 27 States were consistently less than the national rate and 11 were consistently greater. Birth rates for 14 States did not differ significantly from the national birth rate. Several States had notable changes in comparison to the national rate. Three States (Colorado, Kansas, and North Carolina) had birth rates less than the national rate through 1996, but by 1998 the rates for these States equaled or exceeded the national rate, and continued to exceed the national rate through 2001. The District of Columbia, where birth rates declined by 32 percent between 1990 and 2001, however, followed a different path, with birth rates significantly greater than the national rate through 1995 and significantly less from 1998 through 2001.

The **fertility rate** declined significantly between 1990 and 2001 for 42 States and the District of Columbia ([table 10](#)). Fertility rates for three States increased between 1990 and 2001 with the fertility rate for Colorado increasing significantly. The fertility rate trends for most States paralleled changes in the national fertility rate between 1990 and 2001. Overall the national fertility rate declined 8 percent between 1990 and 2001; however, between 1990 and 1997 the national fertility rate declined 10 percent. Between 1997 and 2000 the fertility rate increased by 4 percent only to decline in 2001 by 1 percent. Between 1990 and 1997, fertility rates were down in every State and the District of Columbia. Declines in the fertility rate ranged from 2 percent for

Oklahoma to 24 percent for the District of Columbia. Between 1997 and 2000 fertility rates increased in 47 States (38 States significantly) with Vermont unchanged, and only California, the District of Columbia, and North Dakota decreasing (significantly for California and North Dakota). Three years of increasing fertility rates came to an end for most States in 2001, with 38 States posting drops in the fertility rate, 17 of these decreases were significant.

More States (27) had overall fertility levels that were consistently less than the national rate, 11 States had fertility rates consistently greater than the national rate. By 2001 seven States moved from having fertility rates significantly less than the national average to rates higher than the national average (Arkansas, Colorado, Georgia, Kansas, Nebraska, North Carolina, and Oklahoma). The District of Columbia's trend was reversed, with fertility rates that were above the national rate in 1990, falling below the national rate by 2001.

State-specific TFRs, which provide a summary measure of lifetime fertility, are shown in [table 7](#). TFRs by State vary substantially among States. For example, in 2001, the TFR ranged from a high of 2,561.5 for Utah, to a low of 1,574.0 for the District of Columbia. These highs and lows were both slightly lower than the 1990 TFR of 2,649.0 for Utah and 1,734.5 for West Virginia. Differences in the TFR between States by year and general trends between 1990 and 2001 by State were similar to those for the general fertility rate.

Birth rates for teenagers by State

Birth rates for teenagers fell significantly in every State and the District of Columbia between 1990 and 2001 ([table 10](#)). Nationally birth rates for women aged 15–19 years increased 3 percent from 1990 to 1991, but after 1991 began a steady decline, with an overall drop of 27 percent between 1991 and 2001. States tended to parallel the national trend. Teenage birth rates increased between 1990 and 1991 in 43 States, with significant increases in 13 States. In 1991 teenage birth rates by State ranged from a low of 33.1 per 1,000 women aged 15–19 years in New Hampshire to a high of 85.3 in Mississippi. The rate for the District of Columbia was 109.6. Between 1991 and 2001, the overall decline in teenage birth rates ranged from 13 percent in Nebraska to 42 percent in the District of Columbia. In 2001 New Hampshire once again had the lowest teenage birth rate (21.1) with the highest State teenage birth rate consistently reported for Mississippi (66.8). Teen birth rates have trended downward since 1991, albeit with minor fluctuations in most States. States reporting declining teenage birth rates outnumbered those with increasing rates by, on average, 7 to 1 in any given year. While many of the annual declines were statistically significant the only significant increase, since 1991, was between 2000 and 2001 in the District of Columbia.

Discussion

The results presented in this report show the impact of revised birth and fertility rates for the United States for the years 1991–2001, calculated using newly released intercensal population estimates consistent with the April 1, 2000, census. The population estimates on which the revised rates are based were produced for the Centers for Disease Control and Prevention's National Center for Health Statistics under a collaborative arrangement with the U.S. Census Bureau. Rates were presented by age, race, and Hispanic origin of

mother; by age, race, Hispanic origin, and marital status of mother; by age and race of father; and, by age and State.

Revised population-based birth and fertility rates from 1991 to 1999, based on the 2000 census, are lower overall than the rates previously published based on populations estimated from the 1990 census. The differences between the 2000-based and 1990-based rates increased steadily from 1991 to 2001. This was true for nearly all age, race, and Hispanic origin groups. As a result, birth and fertility rates were generally overestimated, in some cases substantially, in previously released estimates using the 1990-based population estimates. As expected, revised rates for American Indian, Hispanics, and Asian or Pacific Islanders, in particular, were considerably lower. For example, the revised fertility rate for American Indians was 18 percent lower and the rate for Hispanic women 11 percent lower than previously published rates.

These patterns would be consistent with a substantial underestimate for these populations (32). However, error introduced with the race-bridging procedure in the estimation of smaller population groups, especially American Indian and Asian or Pacific Islander populations, cannot be ruled out as a contributing factor. Revised birth and fertility rates for most other population subgroups (i.e., non-Hispanic whites and blacks) differed little from those previously published. As a result, the revised birth rates using 2000 census-based population estimates indicate a narrower range in rates among population subgroups than was suggested by the previously published rates. This reflects, in larger part, the lower rates for Hispanic women who account for more than 1 in 5 births in the United States.

2. Number of births, crude birth rates, general fertility rates, total fertility rates, and birth rates by age and Hispanic origin of mother and by race for mothers of non-Hispanic origin: United States, 1990–2001	15
3. Crude birth rates, general fertility rates, total fertility rates, and birth rates, by age and race of mother based on the 1990 and 2000 censuses, and percent difference: United States, 1991–2001	18
4. Crude birth rates, general fertility rates, total fertility rates, and birth rates, by age and race and Hispanic origin of mother based on the 1990 and 2000 censuses, and percent difference: United States, 1991–2001	22
5. General fertility rates and birth rates by age of mother, live-birth order, and race of mother: United States, 1990–2001.	28
6. General fertility rates and birth rates by age of mother, live-birth order, Hispanic origin of mother, and by race for mothers of non-Hispanic origin: United States, 1990–2001	38
7. Birth rates for unmarried women, by age, race, and Hispanic origin of mother: United States, 1990–2001	54
8. Birth rates for married women, by age, race, and Hispanic origin of mother: United States, 1990–2001.	56
9. Birth rates by age and race of father: United States, 1990–2001	58
10. Number of births, birth rates, fertility rates, total fertility rates, and birth rates by age of mother: United States and each State, 1990–2001	59

Table 1. Number of births, crude birth rates, general fertility rates, total fertility rates, and birth rates, by age and race of mother: United States, 1990–2001

[Birth rates are live births per 1,000 population in specified group. Fertility rates are live births per 1,000 women aged 15–44 years in specified group. Total fertility rates are sums of birth rates for 5-year age groups multiplied by 5. Age-specific rates are live births per 1,000 women in specified age and racial group. Population enumerated as of April 1 for 1990 and 2000 and estimated as of July 1 for all other years. Rates for 1991–2001 have been revised using population estimates based on the 2000 census, and may differ from rates previously published; see text and "Technical Notes"]

Table 1. Number of births, crude birth rates, general fertility rates, total fertility rates, and birth rates, by age and race of mother: United States, 1990–2001—Con.

[Birth rates are live births per 1,000 population in specified group. Fertility rates are live births per 1,000 women aged 15–44 years in specified group. Total fertility rates are sums of birth rates for 5-year age groups multiplied by 5. Age-specific rates are live births per 1,000 women in specified age and racial group. Population enumerated as of April 1 for 1990 and 2000 and estimated as of July 1 for all other years. Rates for 1991–2001 have been revised using population estimates based on the 2000 census, and may differ from rates previously published; see text and "Technical Notes"]

* Figure does not meet standards of reliability or precision; based on fewer than 20 births in numerator.

¹Beginning 1997, rates computed by relating births to women aged 45–54 years to women aged 45–49 years.

²For 1990–1991 includes births to races not shown separately.

³Includes births to Aleuts and Eskimos.

NOTES: Race and Hispanic origin are reported separately on birth certificates. In this table all women (including Hispanic women) are classified only according to their race; see "Technical Notes." Denominators for population-based rates for 1991–2001 are derived from the 2000 census.

Table 2. Number of births, crude birth rates, general fertility rates, total fertility rates, and birth rates by age and Hispanic origin of mother and by race for mothers of non-Hispanic origin: United States, 1990–2001

[Birth rates are live births per 1,000 population in specified group. Fertility rates are live births per 1,000 women aged 15–44 years in specified group. Total fertility rates are sums of birth rates for 5-year age groups multiplied by 5. Age-specific rates are live births per 1,000 women in specified age and racial group. Population enumerated as of April 1 for 1990 and 2000 and estimated as of July 1 for all other years. Rates for 1991–2001 have been revised using population estimates based on the 2000 census, and may differ from rates previously published; see text and "Technical Notes"]

Table 2. Number of births, crude birth rates, general fertility rates, total fertility rates, and birth rates by age and Hispanic origin of mother and by race for mothers of non-Hispanic origin: United States, 1990–2001—Con.

[Birth rates are live births per 1,000 population in specified group. Fertility rates are live births per 1,000 women aged 15–44 years in specified group. Total fertility rates are sums of birth rates for 5-year age groups multiplied by 5. Age-specific rates are live births per 1,000 women in specified age and racial group. Population enumerated as of April 1 for 1990 and 2000 and estimated as of July 1 for all other years. Rates for 1991–2001 have been revised using population estimates based on the 2000 census, and may differ from rates previously published; see text and "Technical Notes"]

--- Population denominator data not available.

* Figure does not meet standards of reliability or precision; based on either fewer than 20 births in numerator or, for the Hispanic subgroups, fewer than 50 women for census years and 75,000 women for non-census years in the denominator; see "Technical Notes." These guidelines follow the suggestions of the U.S. Census Bureau.

¹Beginning 1997, rates computed by relating births to women aged 45–54 years to women aged 45–49 years.

²Includes origin not stated.

³Excludes data for New Hampshire, which did not report Hispanic origin.

⁴Excludes data for New Hampshire and Oklahoma, which did not report Hispanic origin.

⁵Includes Central and South American and other and unknown Hispanic.

⁶Includes races other than white and black.

NOTES: Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. In this table Hispanic women are classified only by place of origin; non-Hispanic women are classified by race; see "Technical Notes." Denominators for population-based rates for 1991–2001 are derived from the 2000 census.

Table 3. Crude birth rates, general fertility rates, total fertility rates, and birth rates, by age and race of mother based on the 1990 and 2000 censuses, and percent difference: United States, 1991–2001

[Birth rates are live births per 1,000 population in specified group. Fertility rates are live births per 1,000 women aged 15–44 years in specified group. Total fertility rates are sums of birth rates for 5-year age groups multiplied by 5. Age-specific rates are live births per 1,000 women in specified age and racial group. Population enumerated as of April 1 for 1990 and 2000 and estimated as of July 1 for all other years]

Table 3. Crude birth rates, general fertility rates, total fertility rates, and birth rates, by age and race of mother based on the 1990 and 2000 censuses, and percent difference: United States, 1991–2001—Con.

[Birth rates are live births per 1,000 population in specified group. Fertility rates are live births per 1,000 women aged 15–44 years in specified group. Total fertility rates are sums of birth rates for 5-year age groups multiplied by 5. Age-specific rates are live births per 1,000 women in specified age and racial group. Population enumerated as of April 1 for 1990 and 2000 and estimated as of July 1 for all other years]

Table 3. Crude birth rates, general fertility rates, total fertility rates, and birth rates, by age and race of mother based on the 1990 and 2000 censuses, and percent difference: United States, 1991–2001—Con.

[Birth rates are live births per 1,000 population in specified group. Fertility rates are live births per 1,000 women aged 15–44 years in specified group. Total fertility rates are sums of birth rates for 5-year age groups multiplied by 5. Age-specific rates are live births per 1,000 women in specified age and racial group. Population enumerated as of April 1 for 1990 and 2000 and estimated as of July 1 for all other years]

0.0 Quantity more than zero but less than 0.05.

* Figure does not meet standards of reliability or precision; based on fewer than 20 births in numerator.

... Category not applicable.

¹For 1991 includes births to races not shown separately.

²Beginning 1997, rates computed by relating births to women aged 45–54 years to women aged 45–49 years.

³Includes births to Aleuts and Eskimos.

NOTES: Race and Hispanic origin are reported separately on birth certificates. In this table all women (including Hispanic women) are classified only according to their race; see "Technical Notes." Denominators for population-based rates for 1991–2001 are derived from the 2000 census.

Table 4. Crude birth rates, general fertility rates, total fertility rates, and birth rates, by age and race and Hispanic origin of mother based on the 1990 and 2000 censuses, and percent difference: United States, 1991–2001

[Birth rates are live births per 1,000 population in specified group. Fertility rates are live births per 1,000 women aged 15–44 years in specified group. Total fertility rates are sums of birth rates for 5-year age groups multiplied by 5. Age-specific rates are live births per 1,000 women in specified age and racial group. Population enumerated as of April 1 for 1990 and 2000 and estimated as of July 1 for all other years]

Table 4. Crude birth rates, general fertility rates, total fertility rates, and birth rates by age and race and Hispanic origin of mother based on the 1990 and 2000 censuses, and percent difference: United States, 1991–2001—Con.

[Birth rates are live births per 1,000 population in specified group. Fertility rates are live births per 1,000 women aged 15–44 years in specified group. Total fertility rates are sums of birth rates for 5-year age groups multiplied by 5. Age-specific rates are live births per 1,000 women in specified age and racial group. Population enumerated as of April 1 for 1990 and 2000 and estimated as of July 1 for all other years]

Year and race	Age-specific rate

Table 4. Crude birth rates, general fertility rates, total fertility rates, and birth rates, by age and race and Hispanic origin of mother based on the 1990 and 2000 censuses, and percent difference: United States, 1991–2001—Con.

[Birth rates are live births per 1,000 population in specified group. Fertility rates are live births per 1,000 women aged 15–44 years in specified group. Total fertility rates are sums of birth rates for 5-year age groups multiplied by 5. Age-specific rates are live births per 1,000 women in specified age and racial group. Population enumerated as of April 1 for 1990 and 2000 and estimated as of July 1 for all other years]

Table 4. Crude birth rates, general fertility rates, total fertility rates, and birth rates by age and race and Hispanic origin of mother based on the 1990 and 2000 censuses, and percent difference: United States, 1991–2001—Con.

[Birth rates are live births per 1,000 population in specified group. Fertility rates are live births per 1,000 women aged 15–44 years in specified group. Total fertility rates are sums of birth rates for 5-year age groups multiplied by 5. Age-specific rates are live births per 1,000 women in specified age and racial group. Population enumerated as of April 1 for 1990 and 2000 and estimated as of July 1 for all other years]

Year and race	Age-specific rate																	
	20–24 years			25–29 years			30–34 years			35–39 years			40–44 years			45–49 years ³

Table 4. Crude birth rates, general fertility rates, total fertility rates, and birth rates, by age and race and Hispanic origin of mother based on the 1990 and 2000 censuses, and percent difference: United States, 1991–2001—Con.

[Birth rates are live births per 1,000 population in specified group. Fertility rates are live births per 1,000 women aged 15–44 years in specified group. Total fertility rates are sums of birth rates for 5-year age groups multiplied by 5. Age-specific rates are live births per 1,000 women in specified age and racial group. Population enumerated as of April 1 for 1990 and 2000 and estimated as of July 1 for all other years]

0.0 Quantity more than zero but less than 0.05.

--- Population denominator data not available.

... Category not applicable.

* Figure does not meet standards of reliability or precision; based on either fewer than 20 births in numerator or, for the Hispanic subgroups, fewer than 50 persons for census years and 75,000 persons for non-census years in the denominator; see "Technical Notes." These guidelines follow the suggestions of the U.S. Census Bureau.

¹Includes origin not stated.

²Excludes data for New Hampshire, which did not report Hispanic origin.

³Beginning 1997, rates computed by relating births to women aged 45–54 years to women aged 45–49 years.

⁴Includes Central and South American and other and unknown Hispanic.

⁵Includes races other than white and black.

NOTES: Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. In this table Hispanic women are classified only by place of origin; non-Hispanic women are classified by race; see "Technical Notes." Denominators for population-based rates for 1991–2001 are derived from the 2000 census.

Table 5. General fertility rates and birth rates by age of mother, live-birth order, and race of mother: United States, 1990–2001

[Birth rates are live births per 1,000 population in specified group and racial group. Fertility rates are live births per 1,000 women aged 15–44 years in specified group. Live-birth order refers to number of children born alive to mother. Figures for live-birth order not stated are distributed. Rates for 1991–2001 have been revised using population estimates based on the 2000 census, and may differ from rates previously published; see text and "Technical Notes"]

Table 5. General fertility rates and birth rates by age of mother, live-birth order, and race of mother: United States, 1990–2001—Con.

[Birth rates are live births per 1,000 population in specified group and racial group. Fertility rates are live births per 1,000 women aged 15–44 years in specified group. Live-birth order refers to number of children born alive to mother. Figures for live-birth order not stated are distributed. Rates for 1991–2001 have been revised using population estimates based on the 2000 census, and may differ from rates previously published; see text and "Technical Notes"]

Table 5. General fertility rates and birth rates by age of mother, live-birth order, and race of mother: United States, 1990–2001—Con.

[Birth rates are live births per 1,000 population in specified group and racial group. Fertility rates are live births per 1,000 women aged 15–44 years in specified group. Live-birth order refers to number of children born alive to mother. Figures for live-birth order not stated are distributed. Rates for 1991–2001 have been revised using population estimates based on the 2000 census, and may differ from rates previously published; see text and "Technical Notes"]

Table 5. General fertility rates and birth rates by age of mother, live-birth order, and race of mother: United States, 1990–2001—Con.

[Birth rates are live births per 1,000 population in specified group and racial group. Fertility rates are live births per 1,000 women aged 15–44 years in specified group. Live-birth order refers to number of children born alive to mother. Figures for live-birth order not stated are distributed. Rates for 1991–2001 have been revised using population estimates based on the 2000 census, and may differ from rates previously published; see text and "Technical Notes"]

8th child and over	0.8	*	*	*	*	0.1	0.5	1.2	1.7	0.5

0.0 Quantity more than zero but less than 0.05.

* Figure does not meet standards of reliability or precision; based on fewer than 20 births in numerator.

¹Beginning 1997, rates computed by relating births to women aged 45–54 years to women aged 45–49 years.

²For 1990–1991 includes births to races not shown separately.

³Includes births to Aleuts and Eskimos.

NOTES: Race and Hispanic origin are reported separately on birth certificates. In this table all women (including Hispanic women) are classified only according to their race; see "Technical Notes." Denominators for population-based rates for 1991–2001 are derived from the 2000 census.

Table 6. General fertility rates and birth rates by age of mother, live-birth order, Hispanic origin of mother, and by race for mothers of non-Hispanic origin: United States, 1990–2001

[Birth rates are live births per 1,000 population in specified group and Hispanic origin/race group. Fertility rates are live births per 1,000 women aged 15–44 years in specified group. Live-birth order refers to number of children born alive to mother. Figures for live-birth order not stated are distributed. Rates for 1991–2001 have been revised using population estimates based on the 2000 census, and may differ from rates previously published; see text and "Technical Notes"]

Table 6. General fertility rates and birth rates by age of mother, live-birth order, Hispanic origin of mother, and by race for mothers of non-Hispanic origin: United States, 1990–2001—Con.

[Birth rates are live births per 1,000 population in specified group and Hispanic origin/race group. Fertility rates are live births per 1,000 women aged 15–44 years in specified group. Live-birth order refers to number of children born alive to mother. Figures for live-birth order not stated are distributed. Rates for 1991–2001 have been revised using population estimates based on the 2000 census, and may differ from rates previously published; see text and "Technical Notes"]

Table 6. General fertility rates and birth rates by age of mother, live-birth order, Hispanic origin of mother, and by race for mothers of non-Hispanic origin: United States, 1990–2001—Con.

[Birth rates are live births per 1,000 population in specified group and Hispanic origin/race group. Fertility rates are live births per 1,000 women aged 15–44 years in specified group. Live-birth order refers to number of children born alive to mother. Figures for live-birth order not stated are distributed. Rates for 1991–2001 have been revised using population estimates based on the 2000 census, and may differ from rates previously published; see text and "Technical Notes"]

Table 6. General fertility rates and birth rates by age of mother, live-birth order, Hispanic origin of mother, and by race for mothers of non-Hispanic origin: United States, 1990–2001—Con.

[Birth rates are live births per 1,000 population in specified group and Hispanic origin/race group. Fertility rates are live births per 1,000 women aged 15–44 years in specified group. Live-birth order refers to number of children born alive to mother. Figures for live-birth order not stated are distributed. Rates for 1991–2001 have been revised using population estimates based on the 2000 census, and may differ from rates previously published; see text and "Technical Notes"]

Table 6. General fertility rates and birth rates by age of mother, live-birth order, Hispanic origin of mother, and by race for mothers of non-Hispanic origin: United States, 1990–2001—Con.

[Birth rates are live births per 1,000 population in specified group and Hispanic origin/race group. Fertility rates are live births per 1,000 women aged 15–44 years in specified group. Live-birth order refers to number of children born alive to mother. Figures for live-birth order not stated are distributed. Rates for 1991–2001 have been revised using population estimates based on the 2000 census, and may differ from rates previously published; see text and "Technical Notes"]

0.0 Quantity more than zero but less than 0.05.

* Figure does not meet standards of reliability or precision; based on either fewer than 20 births in numerator or, for the Hispanic subgroups, fewer than 50 women for census years and 75,000 women for non-census years in the denominator; see "Technical Notes." These guidelines follow the suggestions of the U.S. Census Bureau.

--- Data not available.

¹Beginning 1997, rates computed by relating births to women aged 45–54 years to women aged 45–49 years.

²Includes Central and South American and other and unknown Hispanic.

³Includes origin not stated.

⁴Includes races other than white and black.

⁵Excludes data for New Hampshire, which did not report Hispanic origin.

⁶Excludes data for New Hampshire and Oklahoma, which did not report Hispanic origin.

NOTES: Race and Hispanic origin are reported separately on birth certificates. Persons of Hispanic origin may be of any race. In this table Hispanic women are classified only by place of origin; non-Hispanic women are classified by race; see "Technical Notes." Denominators for population-based rates for 1991–2001 are derived from the 2000 census.

Table 7. Birth rates for unmarried women, by age, race, and Hispanic origin of mother: United States, 1990–2001

[Rates are live births per 1,000 unmarried women in specified group. Population estimated as of July 1 for all years. Rates for 1991–2001 have been revised, using population estimates based on the 2000 census, and may differ from rates previously published; see text and "Technical Notes"]

--- Data not available.

¹Rates computed by relating total births to unmarried women, regardless of age of mother, to unmarried women aged 15–44 years.

²Rates computed by relating births to unmarried women aged 40 years and over to unmarried women aged 40–44 years.

³Includes races other than white, black, and Asian or Pacific Islander.

⁴Race and Hispanic origin are reported separately on birth certificates. Data for persons of Hispanic origin are also included in the data for each race group according to the mother's reported race; see references 15 and 28.

⁵Birth rates for 1990 exclude data for New Hampshire and Oklahoma, which did not report Hispanic origin.

⁶Rate shown for ages 35–39 years in 1990 is based on births to unmarried women aged 35–44 years.

⁷Includes all persons of Hispanic origin of any race.

⁸Birth rates for 1991 and 1992 exclude data for New Hampshire, which did not report Hispanic origin.

NOTE: Birth rates cannot be computed for unmarried non-Hispanic black women or for unmarried American Indian women because the necessary populations are not available.

Table 8. Birth rates for married women, by age, race, and Hispanic origin of mother: United States, 1990–2001

[Rates are live births per 1,000 married women in specified group. Population estimated as of July 1 for all years. Rates for 1991–2001 have been revised, using population estimates based on the 2000 census, and may differ from rates previously published; see text and "Technical Notes"]

* Figure does not meet standards of reliability or precision.

¹Rates computed by relating total births to married women, regardless of age of mother, to married women aged 15–44 years.

²Rates computed by relating births to married women aged 40 years and over to married women aged 40–44 years.

³Includes races other than white, black, and Asian or Pacific Islander.

⁴Race and Hispanic origin are reported separately on birth certificates. Data for person of Hispanic origin are also included in the data for each race group according to the mother's reported race; see references 15 and 28.

⁵Includes all persons of Hispanic origin of any race.

⁶Birth rates for 1991 and 1992 exclude data for New Hampshire, which did not report Hispanic origin.

⁷Birth rates for 1990 exclude data for New Hampshire and Oklahoma, which did not report Hispanic origin.

NOTES: Birth rates cannot be computed for married non-Hispanic black women or for married American Indian women because the necessary populations are not available.

Table 9. Birth rates by age and race of father: United States, 1990–2001

[Rates are live births per 1,000 men in specified group. Population enumerated as of April 1 for 1990 and 2000 and estimated as of July 1 for all other years. Figures for age of father not stated are distributed; see "Technical Notes." Rates for 1991–2001 have been revised using population estimates based on the 2000 census, and may differ from rates previously published; see text and "Technical Notes"]

¹Rates computed by relating total births, regardless of age of father, to men aged 15–54 years.

²Rates computed by relating births of fathers under 20 years of age to men aged 15–19 years.

³Includes races other than white and black.

NOTES: Race and Hispanic origin are reported separately on birth certificates. In this table all men (including Hispanic men) are classified only according to their race. Age of father was not stated for 13.5 percent of births in 2001.

**Table 10. Number of births, birth rates, fertility rates, total fertility rates, and birth rates by age of mother:
United States, and each State, 1990–2001**

[By place of residence. Birth rates are live births per 1,000 estimated population in each area; fertility rates are live births per 1,000 women aged 15–44 years estimated in each area; total fertility rates are sums of birth rates for 5-year age groups multiplied by 5; birth rates are live births per 1,000 women in specified age group estimated in each area. Rates for 1991–2001 have been revised using population estimates based on the 2000 census, and may differ from rates previously published; see text and "Technical Notes"]

Table 10. Number of births, birth rates, fertility rates, total fertility rates, and birth rates by age of mother: United States, and each State, 1990–2001—Con.

[By place of residence. Birth rates are live births per 1,000 estimated population in each area; fertility rates are live births per 1,000 women aged 15–44 years estimated in each area; total fertility rates are sums of birth rates for 5-year age groups multiplied by 5; birth rates are live births per 1,000 women in specified age group estimated in each area. Rates for 1991–2001 have been revised using population estimates based on the 2000 census, and may differ from rates previously published; see text and "Technical Notes"]

Table 10. Number of births, birth rates, fertility rates, total fertility rates, and birth rates by age of mother: United States, and each State, 1990–2001—Con.

[By place of residence. Birth rates are live births per 1,000 estimated population in each area; fertility rates are live births per 1,000 women aged 15–44 years estimated in each area; total fertility rates are sums of birth rates for 5-year age groups multiplied by 5; birth rates are live births per 1,000 women in specified age group estimated in each area. Rates for 1991–2001 have been revised using population estimates based on the 2000 census, and may differ from rates previously published; see text and "Technical Notes"]

State and year	Number of births	Crude birth rate	General fertility rate ¹	Total fertility rate	10–14 years	15–19 years

Table 10. Number of births, birth rates, fertility rates, total fertility rates, and birth rates by age of mother: United States, and each State, 1990–2001—Con.

[By place of residence. Birth rates are live births per 1,000 estimated population in each area; fertility rates are live births per 1,000 women aged 15–44 years estimated in each area; total fertility rates are sums of birth rates for 5-year age groups multiplied by 5; birth rates are live births per 1,000 women in specified age group estimated in each area. Rates for 1991–2001 have been revised using population estimates based on the 2000 census, and may differ from rates previously published; see text and "Technical Notes"]

State and year	Number of births	Crude birth rate	General fertility rate ¹	Total fertility rate	10–14 years	15–19 years

Table 10. Number of births, birth rates, fertility rates, total fertility rates, and birth rates by age of mother: United States, and each State, 1990–2001—Con.

[By place of residence. Birth rates are live births per 1,000 estimated population in each area; fertility rates are live births per 1,000 women aged 15–44 years estimated in each area; total fertility rates are sums of birth rates for 5-year age groups multiplied by 5; birth rates are live births per 1,000 women in specified age group estimated in each area. Rates for 1991–2001 have been revised using population estimates based on the 2000 census, and may differ from rates previously published; see text and "Technical Notes"]

State and year	Number of births	Crude birth rate	General fertility rate ¹	Total fertility rate	10–14 years	15–19 years

Table 10. Number of births, birth rates, fertility rates, total fertility rates, and birth rates by age of mother: United States, and each State, 1990–2001—Con.

[By place of residence. Birth rates are live births per 1,000 estimated population in each area; fertility rates are live births per 1,000 women aged 15–44 years estimated in each area; total fertility rates are sums of birth rates for 5-year age groups multiplied by 5; birth rates are live births per 1,000 women in specified age group estimated in each area. Rates for 1991–2001 have been revised using population estimates based on the 2000 census, and may differ from rates previously published; see text and "Technical Notes"]

State and year	Number of births	Crude birth rate	General fertility rate ¹	Total fertility rate	10–14 years	15–19 years

Table 10. Number of births, birth rates, fertility rates, total fertility rates, and birth rates by age of mother: United States, and each State, 1990–2001—Con.

[By place of residence. Birth rates are live births per 1,000 estimated population in each area; fertility rates are live births per 1,000 women aged 15–44 years estimated in each area; total fertility rates are sums of birth rates for 5-year age groups multiplied by 5; birth rates are live births per 1,000 women in specified age group estimated in each area. Rates for 1991–2001 have been revised using population estimates based on the 2000 census, and may differ from rates previously published; see text and "Technical Notes"]

--- Data not available.

¹ Figure does not meet standards of reliability or precision; based on fewer than 20 births in the numerator.²Fertility rates computed by relating total births, regardless of age of mother, to women aged 15–44 years.²Beginning in 1997, rates computed by relating births to women aged 45–54 years to women aged 45–49.

Technical Notes

Sources of data

Data presented in this report are based on information reported on birth certificates filed for all births in the United States. Data are provided to the National Center for Health Statistics (NCHS) through the Vital Statistics Cooperative Program (VSCP). Details on the data elements collected in the birth certificate file are discussed in previous reports (15–28).

Age of mother

Age of mother is computed in most cases from the mother's and infant's dates of birth as reported on the birth certificate. The mother's age is directly reported by five States (Kentucky, Nevada, North Dakota, Virginia, and Wyoming) and American Samoa. From 1964 to 1996, mother's age was edited for ages 10–49 years. Births reported to occur to mothers younger than age 10 or older than age 49 years had age imputed according to the age of mother from the previous record with the same race and total birth order (total of live births and fetal deaths). Beginning in 1997, age of mother is imputed for ages 9 years or under and 55 years and over. A review and verification of unedited birth data for 1996 showed that the vast majority of births reported as occurring to women aged 50 years and over were to women aged 50–54 years. The numbers of births to women aged 50–54 years are too small for computing age-specific birth rates. These births have been included with births to women aged 45–49 years for computing birth rates.

When age of mother was not reported it was imputed according to the last record with the same race and total birth order. See annual reports for the percent of records where age of mother was not reported (15–26).

Race and Hispanic origin

Race and Hispanic origin are reported separately on the birth certificate. Beginning with the 1989 data year, NCHS started tabulating its birth data primarily by race of the mother. In 1988 and prior years, births were tabulated by the race of the child, which was determined from the race of the parents as entered on the birth certificate.

Trend data by race shown in this report are by race of mother for all years. The text discussions of data by race are based on tabulations by race of mother. Text references to white births and white mothers or black births and black mothers are used interchangeably for ease in writing.

The factors influencing the decision to tabulate births by race of the mother have been discussed in detail elsewhere (23). They include the 1989 revision of the birth certificate, which includes many more health questions which are directly associated with the mother. In these instances, it is more appropriate to tabulate births by the mother's race. A second factor has been the increasing incidence of interracial parentage. In 2001, 5.3 percent of births were to parents of different races compared with just 1.9 percent for 1980. A third factor influencing the decision to tabulate births by race of mother is the large proportion of births where race of father was not reported (13 percent in 2001) (15–25). Although this proportion declined slightly in the 1990s, it is still higher than in 1979, 11 percent. The high proportion of records with the

father's race not reported reflects the increase in the proportion of births to unmarried women; in many such cases, no information is reported on the father. These births are already assigned the race of the mother because there is no alternative. Tabulating all births by race of mother, therefore, provides for a more uniform approach, rather than a necessarily arbitrary combination of parental races.

Race of mother is reported by all registration areas in eight categories: white, black, American Indian, Chinese, Japanese, Hawaiian, Filipino, and "other" Asian or Pacific Islander (API). In addition, 11 States (California, Hawaii, Illinois, Minnesota, Missouri, New Jersey, New York, Texas, Virginia, Washington, and West Virginia) report data on API subgroups included in the "other" API category (Vietnamese, Asian Indian, Korean, Samoan, Guamanian, and remaining API). A report on births in 1992 to women in these API subgroups has been published (38).

In cases where race of mother was not reported, the race of the father was assigned, if known. When information was not available for either parent, the race of the mother was imputed according to the specific race of the mother on the preceding record with a known race of mother. See annual reports for percent of records where race of mother was not reported (15–25).

Hispanic origin and race are reported independently on the birth certificate, as noted previously. Data for Hispanic subgroups are shown in most cases for five groups: Mexican, Puerto Rican, Cuban, Central and South American, and other and unknown Hispanic. In tabulations of birth data by race only, data for persons of Hispanic origin are included in the data for each race group according to the mother's reported race. In tabulations of birth data by race and Hispanic origin, data for persons of Hispanic origin are not further classified by race because the vast majority of births to Hispanic women are reported as white. In these tabulations, data for non-Hispanic persons are classified according to the race of the mother, because there are substantial differences in fertility and maternal and infant health between Hispanic and non-Hispanic white women.

Items asking for the Hispanic origin of the mother and the father have been included on the birth certificates of all States and the District of Columbia since 1993 (26). In 1991 and 1992, New Hampshire did not ask for information on Hispanic origin and in 1990, neither New Hampshire nor Oklahoma collected this information. See annual reports for the percent of records for which Hispanic origin of parents was not reported (15–25).

Marital status

National estimates of births to unmarried women are based on two methods of determining marital status. For 1994 through 1996, birth certificates in 45 States and the District of Columbia included a question about the mother's marital status. Beginning in 1997, the marital status of women giving birth in California and Nevada is determined by a direct question in the birth registration process. Beginning June 15, 1998, Connecticut discontinued inferring the mother's marital status and added a direct question on mother's marital status to the State's birth certificate.

In the two States (Michigan and New York) that used inferential procedures to compile birth statistics by marital status in 2001, a birth is inferred as nonmarital if any of these factors, listed in priority-of-use order, is present: a paternity acknowledgment was received or the father's name is missing. In recent years, a number of States have

extended their efforts to identify the fathers when the parents are not married in order to enforce child support obligations. The presence of a paternity acknowledgment therefore is the most reliable indicator that the birth is nonmarital in the States not reporting this information directly; this is now the key indicator in the nonreporting States. Details of the changes in reporting procedures are described in previous reports (37,39).

Marital status was imputed as "married" for these records where the information is collected as a direct question but not reported. See annual reports for the percent of records where marital status of mother was not reported (15–25).

Population denominators

Birth and fertility rates for 1991–2001 shown in this report have been revised from those published in the annual reports of final data (15–27). Revised rates for 2000 and 2001 were recently published (14). Previously published birth and fertility rates for 1991 to 2001 were based on postcensal population estimates derived from the 1990 census. The revised rates shown here are based on revised population estimates consistent with the 2000 census ([table I](#) and [II](#)) (1–13). The revised population estimates are based on the 2000 census counts by age, race, and sex, which have been modified to be consistent with Office of Management and Budget racial categories as of 1977 and historical categories for birth data. The modification procedures are described in detail elsewhere (33,34). State rates for July 1, 2001, are based on population estimates produced in 2002 (the 2002 "vintage" series), by the U.S. Census Bureau, which incorporated information not included in earlier estimates (13). National rates for July 1, 2001, are based on estimates produced in 2001, by the U.S. Census Bureau, and are used here to be consistent with rates published in "Revised Birth and Fertility Rates for the United States, 2000 and 2001" (1,14). Differences between rates based on adjacent vintage populations estimates are generally very small.

Populations used to calculate the rates for 1991–99 are based on population estimates as of July 1 of each year and were produced by the U.S. Census Bureau, with support from the National Cancer Institute (4–12). The rates for 1990 and 2000 are based on populations from the censuses in those years as of April 1.

The 1991–99 populations estimates for women aged 15–17 and 18–19 years by race and by age for the Hispanic subgroups were prepared by NCHS. Revised population estimates for these groups based on the 2000 census were not available when this report was prepared. The population estimates were prepared by applying proportions derived from the 1990-based population estimates (according to data year, race, and Hispanic origin for the female teenage population, and data year, sex, and age for the Hispanic subgroup population) to the 2000-based population of women aged 15–19 years, and Hispanic females by age group, and adjusting the sum of the population estimates to be consistent with the total population of women aged 15–19 years for each race group and for Hispanics by age (2000 based). Figures for groups may not add to totals due to rounding. Rates for teenagers based on these population estimates are intended as interim measures and caution should be used in interpreting the rates and trends. When the necessary population estimates based on the 2000 census become available from the U.S. Census Bureau, the rates

for women aged 15–17 and 18–19 years will be recalculated and presented. Revised population estimates for the Hispanic subgroups are not expected.

Birth rates for unmarried and married women for 1991–2001 shown in [tables 7](#) and [8](#) are based on distributions of the population by marital status as of March of each year as reported by the U.S. Census Bureau in the March *Current Population Survey* (CPS), which have been adjusted to the July population in each year (4–12) by the Division of Vital Statistics, NCHS (37). The 1991–2001 population levels are consistent with the 2000 census. Unmarried women include never married, widowed, and divorced women.

Computation of rates

In computing birthrates by live-birth order, births with birth order not stated were distributed in the same proportion as births of known live-birth order. This procedure is done separately by age and race.

In computing birth and fertility rates for the Hispanic population, births with origin of mother not stated are included with non-Hispanic births rather than being distributed. Thus, rates for the U.S. Hispanic population are underestimates of the true rates to the extent that the births with origin of mother not stated (0.6 percent in 2001) were actually to Hispanic mothers. In computing the rates, the census-based populations with origin not stated are imputed. The effect on the rates is believed to be small.

In computing birth rates by age of father, births where age of father is not stated are distributed in the same proportion as births with known age within each 5-year-age classification of mother. Information on age of father is often missing on birth certificates of children born to unmarried women. This procedure is followed because, while father's age is missing on 13 percent of all birth certificates in 2001, the age is missing from more than a third of records where the mother is a teenager. This distribution procedure is done separately by race. The resulting distributions are summed to form a composite frequency distribution that is the basis for computing birth rates by age of father. This procedure avoids the distortion in rates that would result if the relationship between age of mother and age of father were disregarded.

An asterisk (*) is shown in place of any derived rate based on fewer than 20 births in the numerator, or a population denominator of less than 50 (unweighted) for decennial years and 75,000 (weighted) for all other years for the Hispanic subgroups. Rates based on populations below these minimum levels lack sufficient reliability for analytic purposes. These guidelines follow the suggestions of the U.S. Census Bureau (40,41). The population estimates for some Hispanic subgroups, especially Cubans, do not meet the above minimum. Therefore, age-specific rates are not shown for some groups. However, summary fertility measures (i.e., crude birth rate, general fertility rate, and total fertility rate) are possible and these have been included.

Random variation and significance testing for natality data

The number of births reported for an area is essentially a complete count, because more than 99 percent of all births are registered. Although this number is not subject to sampling error, it may be affected by nonsampling errors in the registration process such as mistakes in recording the mother's residence or age during the registration process.

Table I. Total population and female population, by age, race and Hispanic origin: United States, 1990–2001

Year, race, and origin	Total population	Female

--- Data not available.

¹State populations are based on more recent estimates and will not total to the national population shown. The national population shown is consistent with previously published revised rates as well as the rates shown in this report, and populations shown in table I, see "Technical Notes."

NOTE: The populations for women aged 15–17 and 18–19 years for the United States for 1991–99 were estimated by applying proportions derived from the 1990-based population to the 2000-based population, see "Technical Notes."

SOURCE: National Center for Health Statistics. See references 1–12.

When the number of births is used for analytic purposes (that is, the comparison of numbers, rates, and percents over time, for different areas, or between different groups), the number of events that *actually* occurred can be thought of as one outcome in a large series of possible results that *could have* occurred under the same (or similar) circumstances. When considered in this way, the number of births is subject to random variation and a probable range of values estimated from the actual figures, according to certain statistical assumptions.

The confidence interval is the range of values for the number of births, birth rates, or percent of births that you could expect in 95 out of 100 cases. The confidence limits are the end points of this range of values (the highest and lowest values). Confidence limits tell you how much the number of events or rates could vary under the same (or similar) circumstances.

Confidence limits for numbers and rates can be estimated from the actual number of vital events. Procedures differ for rates and percents and also differ depending on the number of births on which these statistics are based. Below are detailed procedures and examples for each type of case.

When the number of vital events is large, the distribution is assumed to follow a normal distribution (where the relative standard error is small). When the number of events is small and the probability of the event is small, the distribution is assumed to follow a Poisson probability distribution. Considerable caution should be observed in interpreting the occurrence of infrequent events.

95-percent confidence limits for numbers less than 100

When the number of births is less than 100 and the rate is small, the data are assumed to follow a Poisson probability distribution. Confidence limits are estimated using the following formulas:

$$\text{Lower limit} = B * L$$

$$\text{Upper limit} = B * U$$

where

B = number of births

L = the value in [table III](#) that corresponds to the number B , using the 95 percent CI

U = the value in [table III](#) that corresponds to the number B , using the 95 percent CI

Example

Suppose that the number of first births to American Indian women 40–44 years of age was 47. The confidence limits for this number would be:

$$\begin{aligned}\text{Lower limit} &= 47 * 0.73476 \\ &= 35\end{aligned}$$

$$\begin{aligned}\text{Upper limit} &= 47 * 1.32979 \\ &= 63\end{aligned}$$

This means that the chances are 95 out of 100 that the actual number of first births to American Indian women 40–44 years of age would lie between 35 and 63.

95-percent confidence limits for numbers of 100 or more

When the number of events is greater than 100, the data are assumed to approximate a normal distribution. Formulas for 95-percent confidence limits are:

$$\text{Lower limit} = B - (1.96 * \sqrt{B})$$

$$\text{Upper limit} = B + (1.96 * \sqrt{B})$$

where

B = number of births

Example

Suppose that the number of first births to white women 40–44 years of age was 14,108. The 95-percent confidence limits for this number would be:

$$\begin{aligned}\text{Lower limit} &= 14,108 - (1.96 * \sqrt{14,108}) \\ &= 14,108 - 233 \\ &= 13,875\end{aligned}$$

$$\begin{aligned}\text{Upper limit} &= 14,108 + (1.96 * \sqrt{14,108}) \\ &= 14,108 + 233 \\ &= 14,341\end{aligned}$$

This means that the chances are 95 out of 100 that the actual number of first births to white women 40–44 years of age would lie between 13,875 and 14,341.

Computing confidence intervals for rates

The same statistical assumptions can be used to estimate the variability in birth rates. Again, one formula is used for rates based on numbers of events less than 100, and another formula for rates based on numbers of 100 or greater. For our purposes, assume that the denominators of these rates (the population estimates) have no error. While this assumption is technically correct *only* for denominators based on the census that occurs every 10 years, the error in intercensal population estimates is usually small, difficult to measure, and therefore not considered. (See, however, discussion of population denominators earlier in the “Technical Notes.”)

95-percent confidence limits for rates based on fewer than 100 events

When the number of events in the numerator is less than 20, an asterisk (*) is shown in place of the rate because there were too few births to compute a statistically reliable rate. When the number of events in the numerator is greater than 20 but less than 100, the confidence interval for a rate can be estimated using the two formulas that follow and the values in [table III](#).

$$\text{Lower limit} = R * L$$

$$\text{Upper limit} = R * U$$

where

R = birth rate

L = the value in [table III](#) that corresponds to the number B , using the 95 percent CI

U = the value in [table III](#) that corresponds to the number B , using the 95 percent CI

Example

Suppose that the first birth rate for American Indian women 40–44 years of age was 0.50 per 1,000, based on 47 births in the numerator. Using [table III](#):

$$\begin{aligned}\text{Lower limit} &= 0.50 * 0.73476 \\ &= 0.37\end{aligned}$$

$$\begin{aligned}\text{Upper limit} &= 0.50 * 1.32979 \\ &= 0.66\end{aligned}$$

This means that the chances are 95 out of 100 that the actual first birth rate for American Indian women 40–44 years of age is between 0.37 and 0.66.

95-percent confidence limits for rates when the numerator is 100 or more

In this case, use the following formula for the birth rate R based on the number of births B :

$$\text{Lower limit} = R - [1.96 * (R / \sqrt{B})]$$

$$\text{Upper limit} = R + [1.96 * (R / \sqrt{B})]$$

where

R = birth rate

B = number of births

Example

Suppose that the first birth rate for white women 40–44 years of age was 1.55 per 1,000, based on 14,108 births in the numerator. Therefore, the 95-percent confidence interval would be:

$$\begin{aligned}\text{Lower limit} &= 1.55 - [1.96 * (1.55 / \sqrt{14,108})] \\ &= 1.55 - 0.026 \\ &= 1.52\end{aligned}$$

$$\begin{aligned}\text{Upper limit} &= 1.55 + [1.96 * (1.55 / \sqrt{14,108})] \\ &= 1.55 + 0.026 \\ &= 1.58\end{aligned}$$

This means that the chances are 95 out of 100 that the actual first birth rate for white women 40–44 years of age is between 1.52 and 1.58.

Significance testing

One or both of the rates is based on fewer than 100 cases

To compare two rates, when one or both of those rates are based on less than 100 cases, you first compute the confidence intervals for both rates. Then you check to see if those intervals overlap. If they **do** overlap, the difference is not statistically significant at the 95-percent level. If they **do not** overlap, the difference is indeed statistically significant.

Example

Suppose that the first birth rate for American Indian women 40–44 years of age was 0.70 per 1,000 in year X and 0.50 in year Y. Is the rate for year X significantly higher than the rate for year Y? The two rates are based on 63 events in year X and 47 events in year Y. Both rates are based on fewer than 100 events; therefore, the first step is to compute the confidence intervals for both rates.

	Lower Limit	Upper Limit
Year X	0.54	0.90
Year Y	0.37	0.66

These two confidence intervals overlap. Therefore, the first birth rate for American women aged 40–44 years in year X is not significantly higher (at the 95-percent confidence level) than the rate in year Y.

Both rates are based on 100 or more events

When both rates are based on 100 or more events, the difference between the two rates, irrespective of sign (+/-), is considered statistically significant if it exceeds the statistic in the formula below. This statistic equals 1.96 times the standard error for the difference between two rates.

$$1.96 * \sqrt{\frac{R_1^2}{N_1} + \frac{R_2^2}{N_2}}$$

where

R_1 = first rate

R_2 = second rate

N_1 = first number of births

N_2 = second number of births

If the difference is **greater** than this statistic, then the difference would occur by chance less than 5 times out of 100. If the difference is **less than or equal** to this statistic, the difference might occur by chance more than 5 times out of 100. We say that the difference is not statistically significant at the 95-percent confidence level.

Example

Is the first birth rate for black women 40–44 years of age (1.08 per 1,000) significantly lower than the comparable rate for white women (1.55)? Both rates are based on more than 100 births (1,535 for black women and 14,108 for white women). The difference between the rates is $1.55 - 1.08 = 0.47$. The statistic is then calculated as follows:

$$\begin{aligned}&1.96 * \sqrt{\frac{1.08^2}{1,535} + \frac{1.55^2}{14,108}} \\ &= 1.96 * \sqrt{[(1.166 / 1,535) + (2.403 / 14,108)]} \\ &= 1.96 * \sqrt{0.00076 + 0.00017} \\ &= 1.96 * \sqrt{0.00093} \\ &= 1.96 * 0.03 \\ &= 0.06\end{aligned}$$

The difference between the rates (0.47) is greater than this statistic (0.06). Therefore, the difference is statistically significant at the 95-percent confidence level.

Computing confidence intervals for Hispanic subgroups

Population estimates for Hispanic subgroups are derived from the U.S. Census Bureau's *Current Population Survey* and adjusted to resident population control totals as shown in [table I](#). As a result, the rates are subject to the variability of the denominator as well as the numerator. For these Hispanic subgroups only (not for all origin, total Hispanic, total non-Hispanic, non-Hispanic white, or non-Hispanic black populations), the following formulas are used:

Approximate 95-percent confidence interval: 100 or more births

When the number of events in the numerator is greater than 100, the confidence interval for the birth rate can be estimated from the following formulas:

$$\text{Lower limit} = R - 1.96 * R * \sqrt{\left(\frac{1}{B}\right) + f\left(a + \frac{b}{P}\right)}$$

$$\text{Upper limit} = R + 1.96 * R * \sqrt{\left(\frac{1}{B}\right) + f\left(a + \frac{b}{P}\right)}$$

where

R = rate (births per 1,000 population)

B = total number of births upon which rate is based

f = factor that depends on whether the population estimate is based on demographic analysis or CPS and the number of years used, equals 0.670 for single year

a and b are single year averages of the 2000 and 2001 CPS standard error parameters

$a = -0.000162$

$b = 5,648$

P = total estimated population upon which rate is based

Example

Suppose that the fertility rate of Cuban women 15–44 years of age was 51.2 per 1,000 based on 13,088 births in the numerator and an estimated resident population of 255,399 in the denominator. The 95-percent confidence interval would be:

$$\text{Lower limit} = 51.2 - 1.96 * 51.2 *$$

$$\sqrt{\left(\frac{1}{13,088}\right) + 0.670 * \left[-0.000162 + \left(\frac{5,648}{255,399}\right)\right]}$$

$$= 51.2 - 1.96 * 51.2 * \sqrt{0.000076405 + (0.670 * 0.021952)}$$

$$= 51.2 - 1.96 * 51.2 * \sqrt{0.014784}$$

$$= 51.2 - 1.96 * 51.2 * 0.121589$$

$$= 39.00$$

$$\text{Upper limit} = 51.2 + 1.96 * 51.2 *$$

$$\sqrt{\left(\frac{1}{13,088}\right) + 0.670 * \left[-0.000162 + \left(\frac{5,648}{255,399}\right)\right]}$$

$$= 51.2 + 1.96 * 51.2 * \sqrt{0.000076405 + (0.670 * 0.021952)}$$

$$= 51.2 + 1.96 * 51.2 * \sqrt{0.014784}$$

$$= 51.2 + 1.96 * 51.2 * 0.121589$$

$$= 63.40$$

This means that the chances are 95 out of 100 that the actual fertility rate of Cuban women aged 15–44 years is between 39.00 and 63.40.

Approximate 95-percent confidence interval: 1–99 births

When the number of events in the numerator is less than 20, an asterisk (*) is shown in place of the rate. When the number of events in the numerator is greater than 20 but less than 100, the confidence interval for the birth rate can be estimated using the formulas that follow and the values in [table III](#).

$$\text{Lower limit} = R * L (1 - \alpha = 0.96, B) * \left[1 - 2.576 \sqrt{f \left(a + \frac{b}{P}\right)}\right]$$

$$\text{Upper limit} = R * U (1 - \alpha = 0.96, B) * \left[1 + 2.576 \sqrt{f \left(a + \frac{b}{P}\right)}\right]$$

where

R = rate (births per 1,000 population)

B = total number of births upon which rate is based

L = the value in table III that corresponds to the number B , using the 96 percent CI column

U = the value in table III that corresponds to the number B , using the 96 percent CI column

f = factor that depends on whether the population estimate is based on demographic analysis or CPS and the number of years used, equals 0.670 for single year

a and b are CPS standard error parameters (see previous section on 95-percent confidence interval for 100 or more births for description and specific values)

P = total estimated population upon which rate is based

Example

Suppose that the birth rate of Puerto Rican women 45–49 years of age was 0.4 per 1,000, based on 35 births in the numerator and an estimated resident population of 87,892 in the denominator. Using [table III](#), the 95-percent confidence interval would be:

$$\text{Lower limit} = 0.4 * 0.68419 * \left[1 - 2.576 \sqrt{0.670 \left[-0.000162 + \left(\frac{5,648}{87,892}\right)\right]}\right]$$

$$= 0.4 * 0.68419 * (1 - 2.576 \sqrt{0.042946})$$

$$= 0.4 * 0.68419 * (1 - 2.576 * 0.207234)$$

$$= 0.4 * 0.68419 * 0.466165$$

$$= 0.1$$

$$\text{Upper limit} = 0.4 * 1.41047 * \left\{ 1 + 2.576 \sqrt{0.670 \left[-0.000162 + \frac{5,648}{87,892} \right]} \right\}$$

$$= 0.4 * 1.41047 * (1 + 2.576 \sqrt{0.042946})$$

$$= 0.4 * 1.41047 * (1 + 2.576 * 0.207234)$$

$$= 0.4 * 1.41047 * 1.533835$$

$$= 0.9$$

This means that the chances are 95 out of 100 that the actual birth rate of Puerto Rican women 45–49 years of age lies between 0.1 and 0.9. NOTE: In the formulas above, the confidence limits are estimated from the nonsampling error in the number of births, the numerator, and the sampling error in the population estimate, the denominator. A 96-percent standard error is computed for the numerator and a 99-percent standard error is computed for the denominator in order to compute a 95-percent confidence interval for the rate.

Significance testing for Hispanic subgroups

When both rates are based on 100 or more events, the difference between the two rates is considered statistically significant if it exceeds the statistic in the formula below. This statistic equals 1.96 times the standard error for the difference between two rates.

$$= 1.96 * \sqrt{R_1^2 * \left[\left(\frac{1}{B_1} \right) + f \left(a + \frac{b}{P_1} \right) \right] + R_2^2 * \left[\left(\frac{1}{B_2} \right) + f \left(a + \frac{b}{P_2} \right) \right]}$$

If the difference is greater than this statistic, then the difference would occur by chance less than 5 times out of 100. If the difference is less than this statistic, the difference might occur by chance more than 5 times out of 100. We would therefore conclude that the difference is not statistically significant at the 95-percent confidence level.

Example

Suppose the birth rate for Puerto Rican mothers 15–19 years of age (R_1) is 80.6, based on 11,978 births and an estimated population of 148,673, and the birth rate for Cuban mothers 15–19 years of age (R_2) is 27.1, based on 997 births and an estimated population of 36,782 in 2000. Using the above formula, the z score is computed as follows:

$$= 1.96 * \sqrt{80.6^2 * \left[\left(\frac{1}{11,978} \right) + 0.670 \left(-0.000162 + \frac{5,648}{148,673} \right) \right] + 27.1^2 * \left[\left(\frac{1}{997} \right) + 0.670 \left(-0.000162 + \frac{5,648}{36,782} \right) \right]}$$

$$= 1.96 * \sqrt{6,496.36 * (0.000083486 + 0.670 * 0.037827) + 734.41 * (0.001003009 + 0.670 * 0.153391)}$$

$$= 1.96 * \sqrt{(6496.36 * 0.025428) + (734.41 * 0.103775)}$$

$$= 1.96 * \sqrt{165.19 + 76.21}$$

$$= 1.96 * 15.54$$

$$= 30.46$$

Since the difference between the two rates of 53.5 is greater than the value above, the two rates are statistically significantly different at the 0.05 level of significance.

Table III. Lower and upper 95 percent and 96 percent confidence limit factors for birth rates based on a Poisson variable of 1 through 99 births, B
